

Assignment 3

What you need to do:

- set up md2.h & md2.cpp to load models. *NICE UI wanted here... keyboard loses marks over mouse or dialog*
- - grab the data you want from MD2 & store it in your own nice data structure (half-edge) - save MD2 data
- - write code to render your data structure
 - wireframe
 - flat shading \rightarrow GL_TRIANGLES \rightarrow calculate normal Cross Product
 - turn on OpenGL lights
 - smooth shading
 - calculate vertex normals (& display)
 - load model in center of screen
 - determine size & pos of model
 - use glScale / glTranslate to do this
(NOT glOrtho, glFrustum)
 - interface for affine transformations, gluLookAt \rightarrow trackball
 - interface to choose orthographic or perspective

Upcoming Labs

- lighting
- what else do you want me to cover?
- for bonuses, catch me after L5 or via email.
 \rightarrow QTimer

Bonuses

- \rightarrow Animation isn't hard, just replace vertices. Then interpolate
- \rightarrow Weapon ... easiest but have to ensure is in right pos.
- \rightarrow Texture Mapping ... most involved
- \rightarrow Viewing & Transformations ... straight forward.

• num_xyz (per frame)

$i = 0$ to $\text{num_xyz} - 1$

$\rightarrow \text{vertex} \rightarrow (\text{m_vertices}[i][0], \text{m_vertices}[i][1], \text{m_vertices}[i][2])$

• num_st (not necessarily equal to # of vertices)

$\rightarrow \text{Triangles} \rightarrow \text{num_tris}$

$\rightarrow 3$ indices to vertices $\rightarrow \text{index_xyz}[3]$

$\rightarrow 3$ indices to texture coordinates $\rightarrow \text{index_st}[3]$

$\rightarrow \text{num_frames} \rightarrow \# \text{ of key frames}$

\rightarrow Really there are $\text{num_xyz} * \text{num_frames} * \text{vertices}$

anim

To access key frame j you go

for ($i=0; i < \text{num_xyz}; i++$)

$\text{vertex}[i] = (\text{md2.m_vertices}[\underbrace{\text{md2.num_xyz} * j + i}_{[0]}, \underbrace{[1]}, \underbrace{[2]})$

anim_t - first_frame
- last_frame
- fps } specific animation \rightarrow always 21 of these
 \rightarrow several key frames
 \rightarrow rate of fps changes
 \rightarrow interpolate in-between frames

Example: Wave \rightarrow starts at key frame 10
 ends at key frame 17
